

BATCH ALIGNER

Designed to align fish in boxes for better presentation and minimize bent and pressure-damaged fish

**SUSTAINABLE
FISH HANDLING**

BATCH ALIGNER

Revolutionary system for aligning fish in boxes (patent pending). The new invention is based on a market need to improve the quality of the fish that is processed. The fish are moved in a simple but innovative way, ensuring that they are better aligned longitudinally in the box.

The result is hugely improved presentation of the fish in the box, with less pressure damage on the flesh and fewer bent “banana fish” after thawing. The system is integrated within the existing packing line giving the processor a sharper competitive edge in the market. Other advantages are improved processing and less wastage during automated filleting processes at a later stage

MMC FIRST PROCESS has been installing these machines around the world for 5 years.

PROPERTIES

- Compact and space-efficient solution
- Different programs for different species
- High capacity - 10 tonnes/hour

ADVANTAGES

- Easy to operate
- Can be installed within existing packing lines
- Very flexible packing solution

VALUE

- Less pressure damage to fish
- Fewer «banana fish»
- Better visual presentation
